

## **Mechanical myomodulation with HA filler: an innovative treatment with hyaluronic acid fillers**

RC face project is an innovative treatment , and is used not only for rejuvenation and total reharmonization of the face. With mechanical myomodulation it is possible to selectively intervene on some face muscles responsible for excessive muscular tension and which can sometimes be painful for the patient. The attenuation of the hypertonicity of these muscles produces important aesthetic benefits and improvement in the general state of health of the patient.
