

## **Use of transdermal hyaluronidase for complication after dermal filler injections in the nose**

Dr Beatriz Molina will present the use of hyaluronidase, transdermally delivered, by the application of non-ablative Plasma technology (with a plasma-potential handpiece) for the treatment of a complication in the nose, a vascular compression caused 48 hours post hyaluronic acid injection.

Dr Molina will discuss the bio-mechanical effect on the cell adhesion molecules, change in the action potential of the skin cell and the clinically proven sterilisation of bacteria, skin regeneration and the trans dermal delivery of products at a comparable level to injecting.
