

# **Prevention and current management of complications after the placement of tensor threads to treat sagging face**

**Jean-Jacques Deutsch**

Sagging facial skin tissue can often be effectively corrected by applying tensor threads.

Unfortunately, we are witnessing more and more frequently multiple problems. The most common problem is the lack of result that is ultimately not very durable. However, there are rules to follow to avoid these types of inconveniences.

On the other hand, complications are not uncommon, so there are rules here too, in order to reduce their frequency of occurrence as much as possible, or even make them disappear completely.

Finally, when a complication occurs, it is imperative to know what to do, especially in the event of an infection. Excision of a thread is rarely easy.

During this presentation, the actions to be taken, both in the prevention and in the treatment of complications, will be described.
